

PACKET8 VIRTUAL OFFICE BUSINESS PHONE SYSTEM

ONLINE MULTIMEDIA PRODUCT TOUR - VOICE OVER SCRIPT

Introduction

Packet8's Virtual Office is a business phone service that uses the Internet to transport calls – and that means outstanding features along with big savings.

With start-up costs 90% less than standard phone systems and monthly phone bills cut in half, Packet8's Virtual Office offers as much power and flexibility as traditional phone systems.

You get unlimited calling to any phone anywhere for one low monthly fee. Powerful business features include an auto-attendant that distributes incoming calls, call transferring, voice mail, and conferencing.

VOIP is Booming

Packet8 uses voice over internet protocol – VOIP – to provide inexpensive, high-quality telephone service over the Internet for those using high-speed DSL or cable Internet access.

VOIP use has grown 500% in the past 12 months, and, by 2011, 75% of all worldwide calls are expected to be over VOIP!

Packet8 Phone Adapter

Connect the Packet8 Phone Adapter to your high-speed internet modem or router, connect any phone to the Packet8 Adapter, and in less than five minutes you're installed and ready to make and receive calls!

You can keep your existing phone number or choose new numbers with most any US and Canadian area codes; toll free numbers are also available.

Calls can be automatically directed into voice mail, conference bridges and auto-attendant.

The system supports geographic independence with unlimited extensions in the same building – or anywhere else – appearing to be in one location.

The phone system includes all of the standard business phone features, and then some, with no additional costs or service fees.

Extensive Features

Ring Groups allow incoming calls to be routed to a group of phones, which is great for customer service, sales and tech support.

Conference Calls can connect up to twenty sites with both internal extensions and outside callers, with automatic email confirmation of conference call reservations.

With **Voicemail to email**, you can get your voicemail messages via your email! You can receive an email alert notification, or the voice mail can be delivered as an audio file attachment to your email.

Plus **Call Management, Business Class Voice Mail** and even more standard and optional features.

While you can use any phone, the Uniden/Packet8 VOIP Phone includes a built-in WAN/LAN Router with firewall and the Packet8 Phone Adapter.

Features include conference calling, call transfer, pick-up second line (like call waiting), Caller ID/Waiting ID, Distinct Rings, Do Not Disturb Mode, unique tone notification, and a built-in clock.

With the Uniden/Packet8 VOIP Phone, or with the Packet8 Phone Adapter and your own phones, Packet8's Virtual Office is a full-featured VOIP Business Telephone service for small and mid-sized businesses with big ambitions.
